                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Squence 11691, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION:
CESSITORAL INCOMPATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERCGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TILE REFERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 11691
LENGTH: 2304
                                                                                                                         GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.

Sequence 14186, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT FILING DATE: 1999-02-18

FRIOR APPLICATION NUMBER: US 60/074,788

FRIOR APPLICATION NUMBER: US 60/094,190

PRIOR PILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 1186
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1243 CAGCGGCGCCAGGGTCACCCGCCGGAT---ACCGCGGCGCCCCAGGTCGAGCAGGACCTT 1299

The present invention relates to new NOVX polypeptides. The invention is useful for treating or preventing a NOVX-associated disorder such as cardiomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), diabetes, infectious disease, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders and various cancers. The molecules of the invention are also useful for treating or preventing cirrhosis, the invention are also useful for treating or preventing cirrhosis, capacreatitis, learning and memory defects, infertility, congenital heart defects, acne, hair growth, pigmentation disorders, endocrine diseases, capturedistical diseases, bone marrow transplantation, andocrine diseases, allergy and inflammation, nephrological disorders, urinary system disorders, neuropsychiatric disorders and age-related disorders. The present nucleic acid sequence represents a NOVX gene. This sequence

This nucleic acid molecule codes for human gamma-heregulin (gamma-HRG) (see AAW44817), a novel member of the heregulin superfamily, that has a unique N-rerminal domain not present in previously identified heregulins. Gamma-HRG is secreted by human breast cancer MDA-MB-175 calls. It leads to the formation of a constitutive active receptor complex and stimulates to the growth of these cells in an autocrine manner. The nucleic acid was isolated by screening a MDA-MB-175 with a probe corresponding to the EGF-like domain and part of the N-terminal sequences of HRG-beta-3. It can be used for the recombinant production of gamma-HRG, or for in vivo or exvivo gene therapy. A claimed nucleic acid, which is complementary to the nucleic acid sequence encoding the N-terminal domain of gamma-HRG, is blue to reduce production of gamma-HRG by MDA-MB-175 cells. The invention provides claimed methods for activating an ErbB receptor and for enhancing proliferation, differentiation or survival of a cell by contacting the cell (preferably a glial or muscle cell) with gamma-HRG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of cDNA coding for gamma-heregulin (gamma-HRG, see AAY06639). The invention provides HRG ligands, including gamma-HRG, that have affinity for and stimulate HERZ, HER3 and/or HERR4 receptors in autophosphorylation. A new method of treating respiratory distress syndrome in humans uses HERZ, HER3 and/or HER4 receptor ligands as epithelial growth factors. A novel method of inducing epithelial cell growth and/or proliferation comprises contacting a normal epithelial cell which expresses HERZ, HER3 and/or HER4 receptors with an isolated ligand which activates HERZ, HER3 and/or HER4 receptors or their combination. Also claimed are methods of increasing lung surfactant protein A, or of treating chronic obstructive pulmonary disease, respiratory distress or emphysema, by administering an effective amount of an isolated HER ligand to a patient

The patent discloses a method for inducing hair cell generation, or inner ear-supporting cell growth, regeneration, and/or proliferation, by heregulins (HRG), the ligand for HRR2/HER3 dimeric receptors. Heregulin proteins function as activators of HRR-2 oncogene and result from alternate splicing of a single gene mapped to chromosome Bp. The two major types, alpha and beta HRG's are based on two variant BGF-like (epidermal growth factor) domains, that differ in their C-terminal ends. This method can be used to increase the number of inner-ear-supporting calsease states associated with tissue damage, e.g. ofcotoxic injury, acoustic assault, degenerative hearing loss, balance impairments, damage associated with surgery or physical injury and inner ear disorders related to hair cell dysfunction. The present sequence is the human heregulin variant, gamma-HRG protein encoding cDNA, isolated from a native HRG source, such as human MDA-MB-175 cells. It has atleast one biological property as the native sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to inducing epithelial cell growth and/or proliferation comprissing contacting a normal epithelial cell, which expresses HER2, HER3 and/or HER4 (preferably HER2/HER4, HER3) HER2/HER4, HER3 or HER4) receptors with an isolated ligand such as heregulin (HRG) which activates HER2, HER3 and/or HER4 receptors. The mathod is used for inducing epithelial cell (preferably lung cell) growth and/or proliferation, for increasing lung surfactant protein A and for treating respiratory distress or emphysema, for treating chronic
                                                                                                                                                                                 400
                                                                                                                                                                                                                                                                                                                                                                                                Human; heregulin; antiasthmatic; antiinflammatory; vulnerary; antiulcer; epithelial cell growth; HBR2; HBR4; HR6; HBR4; HR0; lung cell; asthma; lung surfactant protein A; respiratory distress; emphysema; pneumonitis; chronic obstructive pulmonary disease; COPD; chronic bronchtis; ulcer; neonatal pulmonary disease; neonatal respiratory distress syndrome; empenital diaphragmatic hernia; lesion; acute lung injury; cystic fibrosis; surgical wound; resection; growth factor; smoke inhalation; gamma-HRG; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a

constant pulmonary diseases including neonatal respiratory diseases including neonatal respiratory diseases including neonatal respiratory diseases syndrome, meconium aspiration syndrome, chronic lung disease of the neonate, congenital diaphragmatic hernia and acute lung injuries including smoke or chemical inhalactor, penemonitis due to aspiration, rediation, near drowning, cystic fibrosis and other epithelial cell crauma diseases including injuries associated with surgical wounds and resections, ulcers, leaions and tissue tears as normal epithelial cell growth factors. For treating infants/neonates with respiratory distress cas well as youth and adult with poor lung function due to lung injury or damage. The HRG binds with varying and very high affinity to the HER2, HER3 and/or HER4 receptors. The method stimulates growth and cells and/or HER4 receptors. The method stimulates growth and cells and allowing the affected tissue to develop comman physiological functions more quickly. Hence the method improves organs and allowing the affected tissue to develop cormal physiological functions more quickly. Hence the method improves organization and speeds of the development of a barrier to infection while treating lung cells that are damaged by inhalation of smoke resulting in cemphysema. It also facilitates regeneration of epithelial cells. The emphysema. It also facilitates regeneration of epithelial cells. The emphysemal procession and procession and procession and procession and procession and procession of epithelial cells. The

The present sequence is a coding sequence for a NOV protein. The NOV proteins and coding sequences are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AIDS, diabetes, obesity, asthma, AIDA mephropathy, cirthosis, arthritis, Alzheimer's disease, infections [e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. Novi is a TEN-M4 like protein and the NoVI gene is localised to chromosome 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      123
